INTRODUCTION

Project Overview

This is system that enables framers to monitor and their farms with a web and mobile based application build with Node-RED. It uses the IBM IOT Watson cloud platform as its Backend. Agriculture is the root to country's economic development. In recent times, huge scientific advancement has been implemented in various agricultural fields for the betterment of the future. Despite of various researches, proper assessment and productivity couldn't be reached. The Agriculture Parameters are utilizing an IOT Technology and system availability that draw in these objects to assemble and deal information. The IOT enables things selected recognized or potentially forced remotely crosswise over completed the process of existing configuration, manufacture open gateways for all the additional obvious merge of the substantial earth into PC based frameworks, in addition to acknowledging overhauled capacity, precision and cash interconnected favoured stance. Precisely when IOT is extended with sensors and actuators, the improvement modifies into an occasion of the all the extra wide category of electronic physical structures, which in like manner incorporates headways, for instance, clever grids, splendid homes, canny moving and smart urban groups.

Purpose

Smart Farming reduce the ecological footprint of farming. Minimized or site specific application of inputs, such as fertilizers and pesticides ,in precision agriculture systems will mitigate leaching problems as well as the emission of greenhouse gases.

- Simple and easy to install and configure.
- Saving energy and resources, so that it can be utilized in a proper way and amount.
- Farmers could smear the right amount of water at the right time by automatic irrigation.
- Avoiding irrigation at the wrong time of day, reduce runoff from over watering saturated soils which will improve crop performance.
- Automated irrigation system uses valves to turn motor ON and OFF.
- It is precise method for irrigation and a valuable tool for accurate soil moisture control in specialized greenhouse vegetable production.
- It is time saving, the human error elimination in adjusting available soil moisture levels

LITERATURE SURVEY

Existing Problem

The biggest challenges faced by IoT in the agricultural sector are lack of information, high adoption costs , and security concerns , etc. Most of the farmers are not aware of the implementation of IoT in agriculture.

Horticulture is the foundation of our Nation. In long time past days agriculturists used to figure the ripeness of soil and influenced presumptions to develop which to kind of product. They didn't think about the dampness, level of water and especially climate condition which horrible an agriculturist more. They utilize pesticides in view of a few suspicions which made lead a genuine impact to the yield if the supposition isn't right. The profitability relies upon the last phase of the harvest on which agriculturist depends.

References

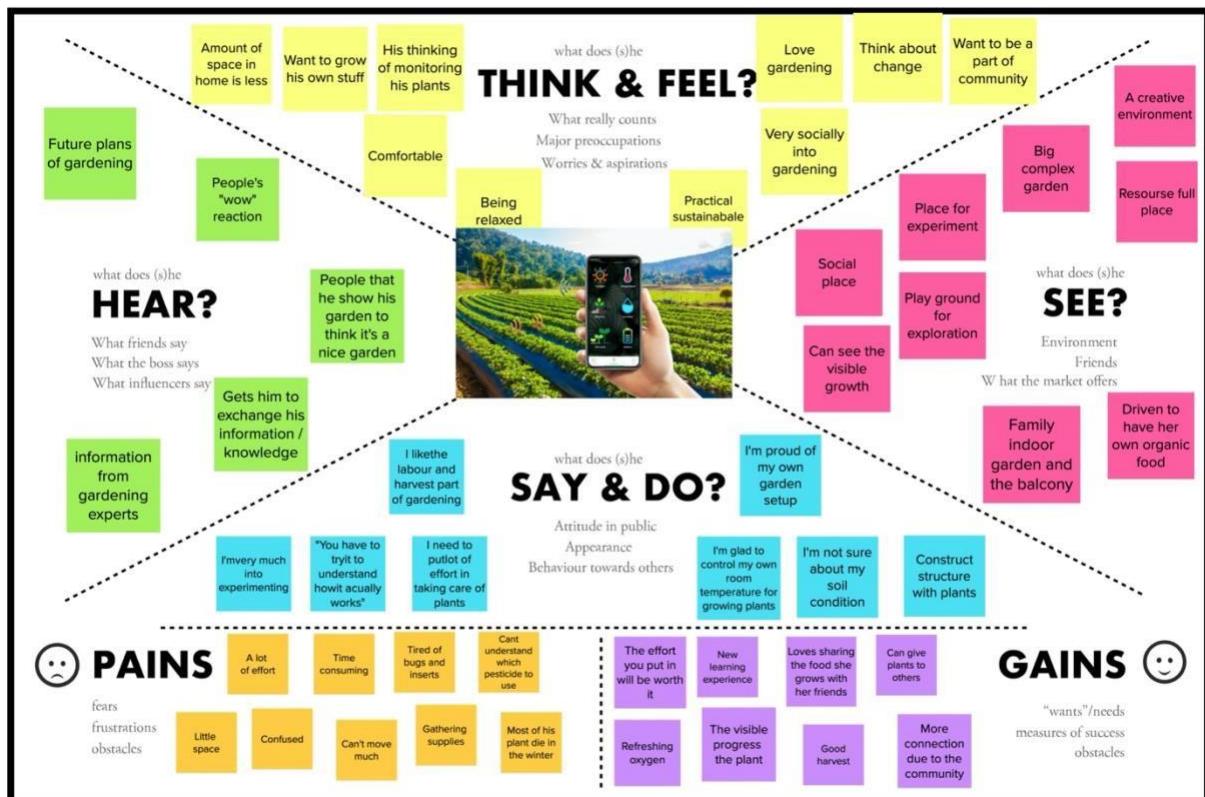

It is the application of modern ICT (Information and Communication Technologies) into agriculture. In IOT- based smart farming, a system is built for monitoring the crop field with the help of sensors (light, humidity, temperature, soil moisture, etc.). The farmers can monitor the field conditions from anywhere.

Problem Statement Definition

Overuse of pesticides and fertilizer in agricultural fields leads to destruction of the crop as well as reduces the efficiency of the field increasing the soil vulnerability toward pest. IoT applications may be used to update the farmer/ user about type & quantity of pesticide required by the crop.

IDEATION & PROPOSED SOLUTION

Empathy Map Canvas

Ideation & Brainstorming

- **Ideation** is the process of generating, developing, and communicating new ideas, where an idea is understood as a basic element of thought that can be either visual, concrete, or abstract.
- **Brainstorming** is a group creative technique by which efforts are made to find a conclusion for a specific problem by gathering a list of ideas spontaneously contributed by its members.

Proposed Solution

Project team shall fill the following information in proposed solution template.

S.No.	Parameter	Description
1.	Problem Statement (Problem to be solved)	Our project will be give the problem statement in Smart farming application using IOT. History-based soil health parameters like soil moisture, pH level, temperature etc.
2.	Idea / Solution description	The most frequently used applications of IoT in agriculture are drones for monitoring fields and spraying crops, health assessment of livestock and irrigation.
3.	Novelty / Uniqueness	Smaít faíming, which involves the application of sensors and automated irrigation practices, can help monitor agricultural land, temperature, soil moisture, etc. This would enable farmers to monitor crops from anywhere.
4.	Social Impact / Customer Satisfaction	Increased production: the optimisation of all the processes related to agriculture and livestock-farming increases production rates. Water saving: weather forecasts and sensors that measure soil moisture mean watering only when necessary and for the right length of time.
5.	Business Model (Revenue Model)	Climate-smart agriculture is a pathway towards development and food security built on three pillars: increasing productivity and incomes, enhancing resilience of livelihoods and ecosystems and reducing and removing greenhouse gas emissions from the atmosphere.
6.	Scalability of the Solution	Smart Farming systems use modern technology to increase the quantity and quality of agricultural products. Livestock tracking and Geo fencing. Smart logistics and warehousing. Smart pest management. Smart Greenhouses

Problem Solution Fit

Project Title:

Project Design Phase-I - Solution Fit Template

Define CS, fit into CC	<p>1. CUSTOMER SEGMENT(S) Who is your customer? i.e. working parents of 0-5 y.o. kids.</p> <p>CS</p> <p>Farmers are our Customers.</p>	<p>6. CUSTOMER CONSTRAINTS What constraints prevent your customers from taking action or limit their choices of solutions? i.e. spending power, budget, no cash, network connection, available devices.</p> <p>CC</p> <p>The availability of device, proper Network facilities and budget are several constraints. Knowledge about the application.</p>	<p>5. AVAILABLE SOLUTIONS Which solutions are available to the customers when they face the problem? i.e. need to get the job done? What have they tried in the past? What pros & cons do these solutions have? i.e. pen and paper is an alternative to digital notetaking</p> <p>AS</p> <p>Most commonly used irrigation type is Drip irrigation the most common disadvantage is when the water is not filtered properly there will be clogs and the tubes will get affected easily. In smart farming we can use solar empowered smart irrigation system to overcome this.</p>	Explore AS, differentiate
Focus on J&P, tap into BE, understand RC	<p>2. JOBS-TO-BE-DONE / PROBLEMS Which jobs-to-be-done (or problems) do you address for your customers? There could be more than one; explore different sides.</p> <p>To make farming easier more quantitatively.</p> <p>1. Monitoring farms climatic conditions. 2. Automatic systems for Irrigation and Fertilization. 3. Soil analysis.</p>	<p>J&P</p> <p>When there is no knowledge about the soil problem arises on what to be sowed, climatic conditions also play a major role. Knowledge on how to water the plants accordingly</p>	<p>9. PROBLEM ROOT CAUSE What is the real reason that this problem exists? What is the back story behind the need to do this job? i.e. customers have to do it because of the change in regulations.</p> <p>RC</p> <p>The customers will reach us when they don't have idea on how to analyse the soil and to improve the current irrigation system</p>	<p>BE</p>
Identify strong TR & EM	<p>3. TRIGGERS What triggers customers to act? i.e. seeing their competitor installing solar panels, reading about a more efficient solution in the news.</p> <p>To get correct accuracy on what to be done on the farm and to produce more crops and livestock quantitatively.</p> <p>TR</p> <p>As when the productivity increases farmers will be satisfied. They will not worry about the loss. Irrigation will be more efficient than before.</p>	<p>10. YOUR SOLUTION If you are working on an existing business, write down your current solution first, fill in the canvas, and check how much it fits really. If you are working on a new business proposition, then keep it blank until you fill in the canvas and come up with a solution that fits within customer limitations, solves a problem and matches customer requirements.</p> <p>SL</p> <p>There will be less weed growth, Maximum use of water efficiently. Control of soil erosion and maximum crop yield.</p>	<p>8. CHANNELS OF BEHAVIOUR 8.1 ONLINE What kind of actions do customers take online? Extract online channels from #7 8.2 OFFLINE What kind of actions do customers take offline? Extract offline channels from #7 and use them for customer development.</p> <p>CH</p> <p>We will reach the customer directly ask about their problems and provide effective solutions if their problems match our application and provide them knowledge about our application to make their farming even more easier.</p>	Identify strong TR & EM

REQUIREMENT ANALYSIS

Functional Requirement

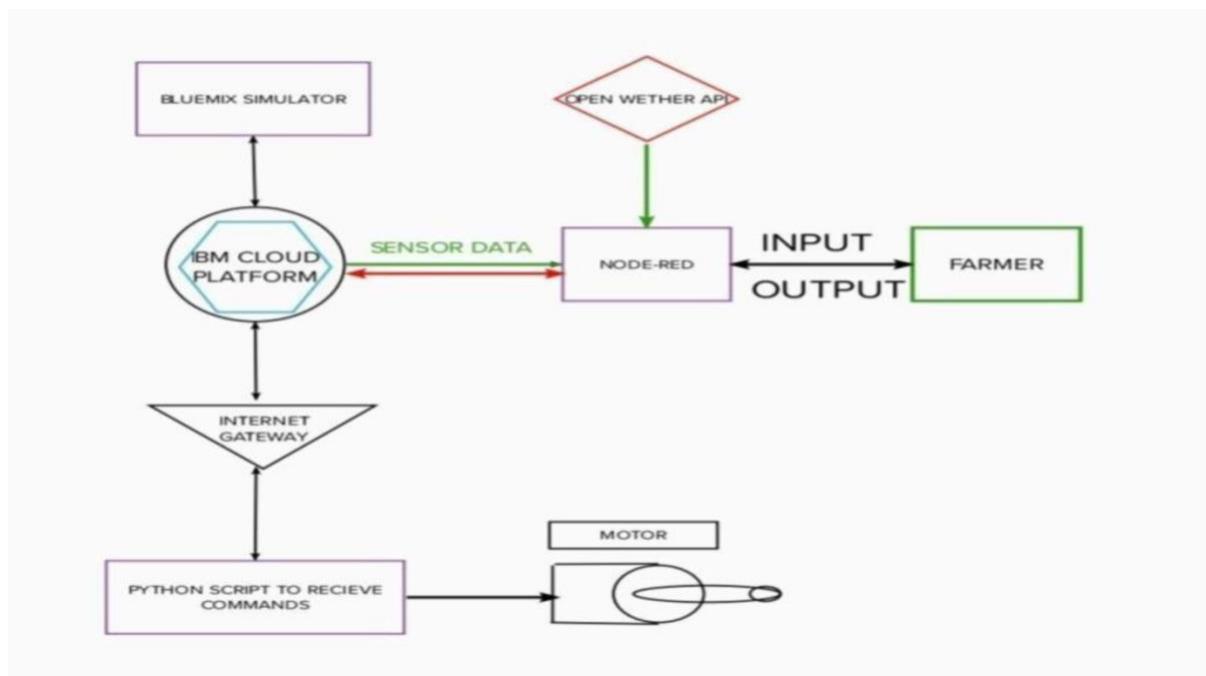

FR NO	Functional Requirement	Sub Requirement(Story/Sub-task)
FR-1	IOT Devices	Sensors and Wi-Fi modules
FR-2	Software	Web UI ,Node-red ,IBM Watson, MIT app

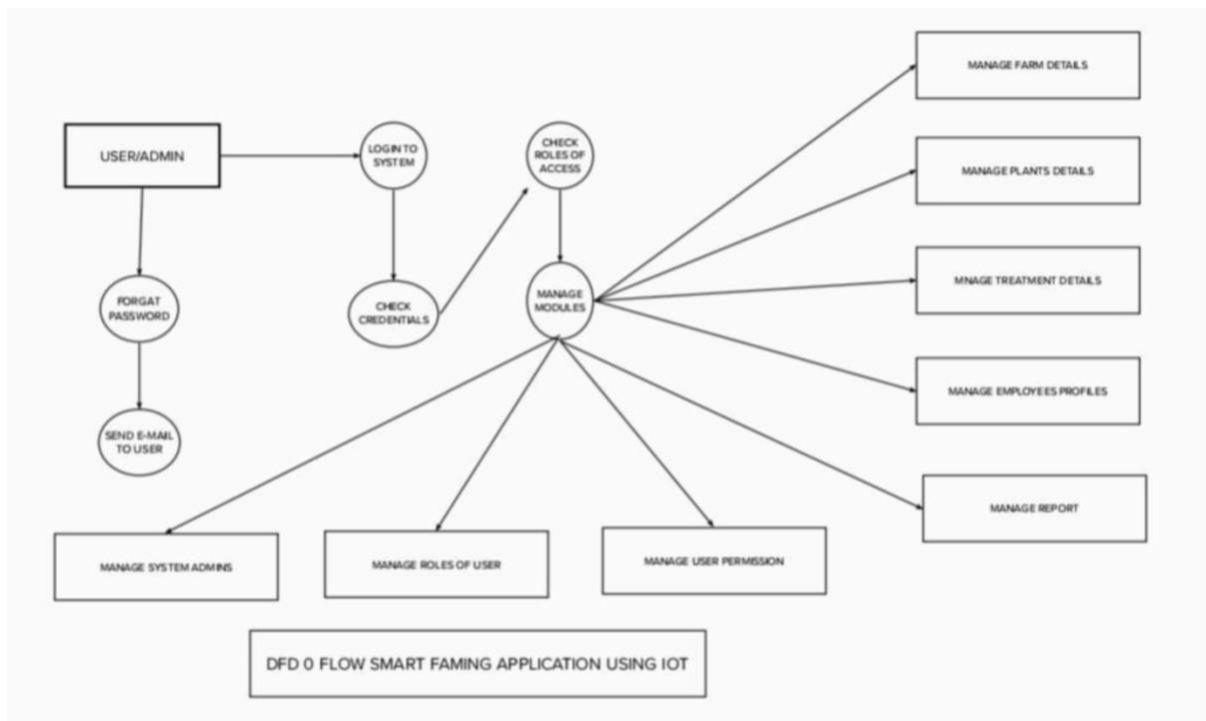

Non-Functional Requirement

FR NO	Non-Functional Requirement	Description
NFR-1	Usability	Time consumability is less , Productivity s less
NFR-2	Security	It has low level security feature due to integration of sensor data
NFR-3	Reliability	Accuracy of data and hence it reliable
NFR-4	Performance	Performance is high productive
NFR-5	Availability	With permitted network connectivity the application is accessible
NFR-6	Scalability	It is perfectly scalable many new constraints can be added

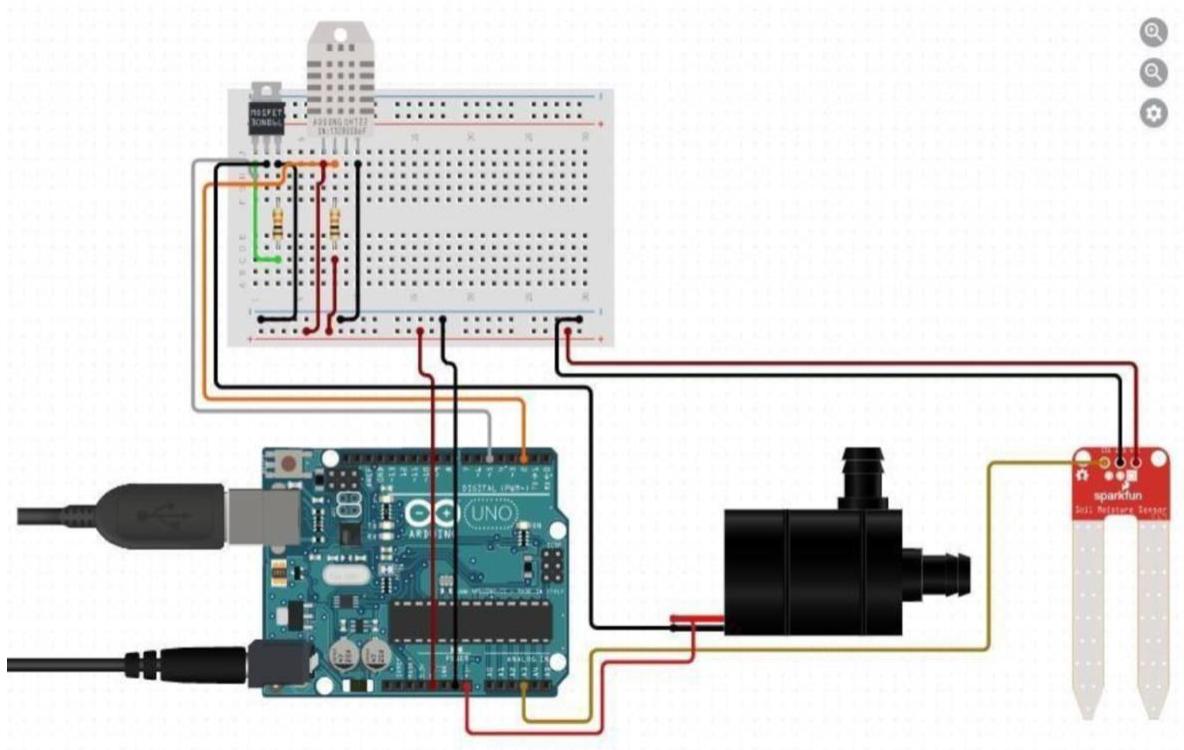

PROJECT DESIGN

Data Flow Diagrams

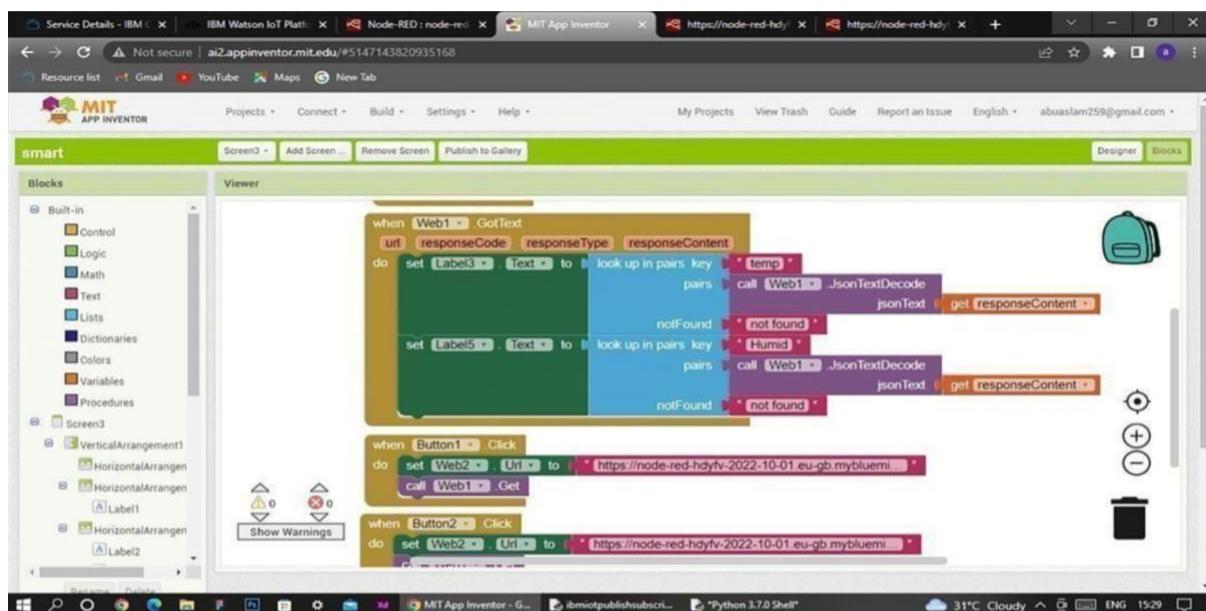

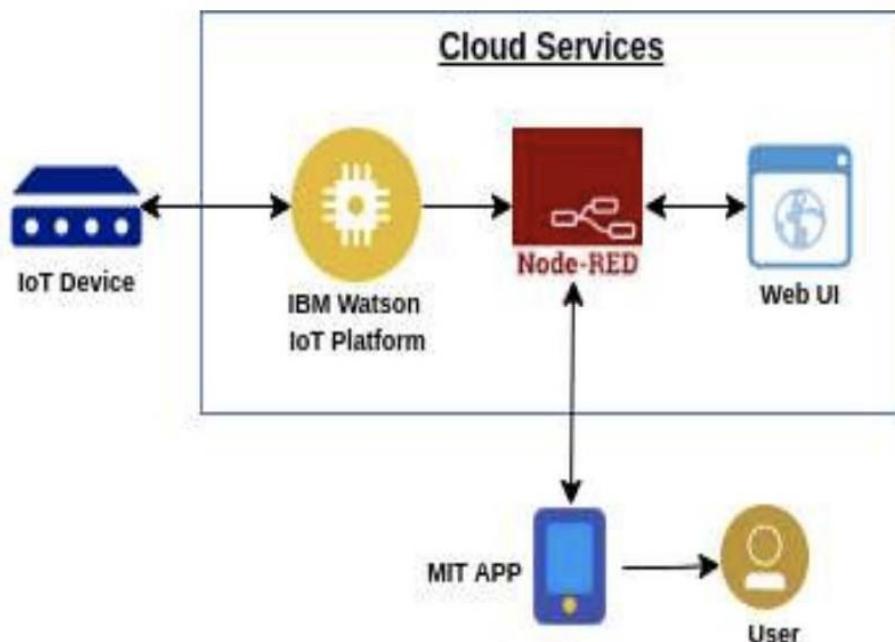

Circuit Diagram

Solution & Technical Architecture

The Deliverable shall include the architectural diagram as below and the information as per the table 1 & table 2

User Stories

User Type	Functional Requirement (Epic)	User Story Number	User Story / Task	Acceptance criteria	Priority	Release
Customer (Mobile user)	Registration	USN-1	As a user, I can register for the application by entering my email, password, and confirming my password.	I can access my account / dashboard	High	Sprint-1
		USN-2	As a user, I will receive confirmation email once I have registered for the application	I can receive confirmation email & click confirm	High	Sprint-1
		USN-3	As a user, I can register for the application through Facebook	I can register & access the dashboard with Facebook Login	Low	Sprint-2
		USN-4	As a user, I can register for the application through Gmail		Medium	Sprint-1
	Login	USN-5	As a user, I can log into the application by entering email & password		High	Sprint-1
	Dashboard					
Customer (Web user)						
Customer Care Executive						
Administrator						

PROJECT PLANNING & SCHEDULING

Sprint Planning & Estimation

Product Backlog, Sprint Schedule, and Estimation (4 Marks)

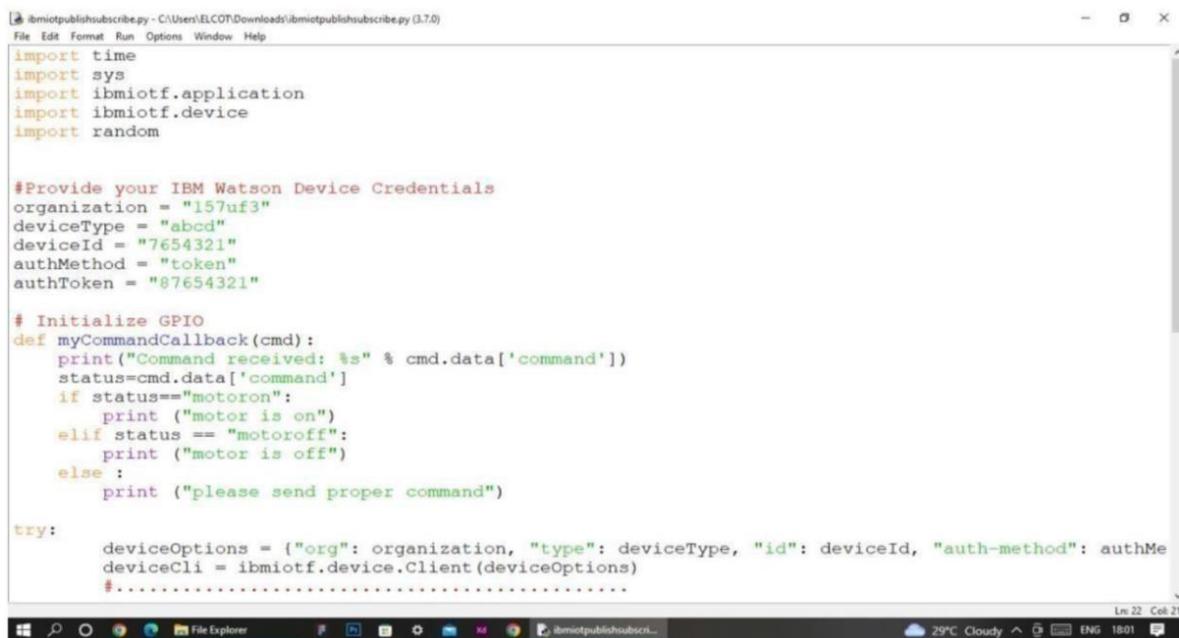

Sprint	Functional Requirement (Epic)	User Story Number	User Story / Task	Story Points	Priority	Team Members
Sprint-1	Simulation creation	USN-1	Connect Sensors and Arduino with python code	2	High	Prasanth M, Naveen P M
Sprint-2	Software	USN-2	Creating device in the IBM Watson IoT platform, workflow for IoT scenarios using Node-Red	2	High	Prasanth M, Naveen T, Niranjan N
Sprint-3	MIT App Inventor	USN-3	Develop an application for the Smart farmer project using MITApp Inventor	2	High	Prasanth M

Sprint-3	Dashboard	USN-3	Design the Modules and test the app	2	High	Niranjan N
Sprint-4	Web UI	USN-4	To make the user to interact with software.	2	High	Niranjan N, Prasanth M, Naveen T, Naveen P M

Sprint Delivery Schedule

Sprint	Total Story Points	Duration	Sprint StartDate	Sprint End Date (Planned)	Story Points Completed (as on Planned End Date)	Sprint Release Date(Actual)
Sprint-1	20	7 Days	30 Oct 2022	06 Nov 2022	20	29 Oct 2022
Sprint-2	20	9 Days	31 Oct 2022	09 Nov 2022		05 Oct 2022
Sprint-3	20	6 Days	06 Nov 2022	13 Nov 2022		12 Oct 2022
Sprint-4	20	6 Days	11 Nov 2022	17 Nov 2022		15 Oct 2022

TESTING

Testcases

You can see the received data in graphs by creating cards in boards tab

The screenshot shows the IBM Watson IoT Platform interface. On the left, there's a sidebar with icons for device types, interfaces, and other management tools. The main area displays a list of devices. One device, '1234', is selected, showing its details: 'Disconnected', 'NodeMCU', and 'Device'. Below this, under 'Recent Events', three entries are listed:

Event	Value	Format	Last Receive
eventflow	{"randomNumber":17,"temp":103,"hum":91}	json	a few seconds ago
eventflow	{"randomNumber":9,"temp":109,"hum":66}	json	a few seconds ago
eventflow	{"randomNumber":77,"temp":101,"hum":98}	json	a few seconds ago

To the right, a modal window is open for 'Device Type: NodeMCU'. It shows an 'Events' tab with an event type named 'eventflow'. The payload is defined as follows:

```
1 "randomNumber": random(0, 100)
2 "temp": random(90, 110)
3 "hum": random(40,100)
4 }
```

Buttons for 'Send', 'Cancel', and 'Save' are visible at the bottom of the modal.

Configuration of Node Red to collect IBM cloud data

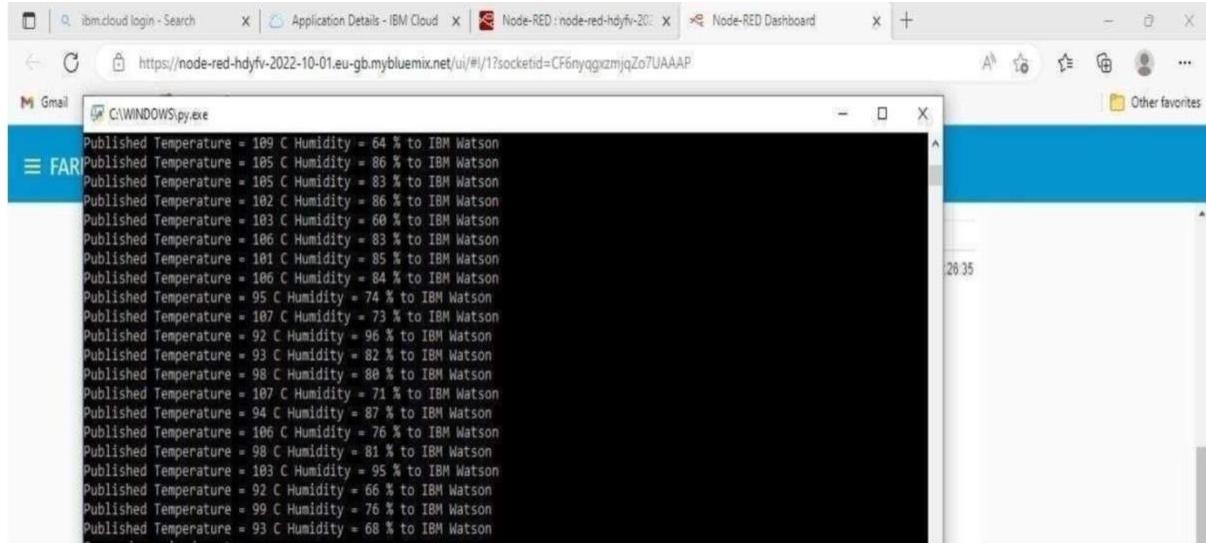

The screenshot shows the Node-RED interface. On the left, the palette contains nodes categorized into 'input', 'output', and 'sequence'. A flow is currently being edited, starting with a 'tcp request' node, followed by a 'Test' node, and ending with an 'IBM iot' node. The 'IBM iot' node is highlighted, indicating it's being configured. A modal window titled 'Edit ibmiot in node > Add new ibmiot config node' is open, showing the following configuration:

Properties	Value
Name	Name
API Key	a-ck2tf0-yutwjjanphx
API Token
Server-Name	orgid.messaging.internetofthings.ibmcloud.com
Scalable	<input type="checkbox"/>
Keep Alive	60 Seconds
Application ID	<input type="text"/>
Use Clean Session	<input checked="" type="checkbox"/>

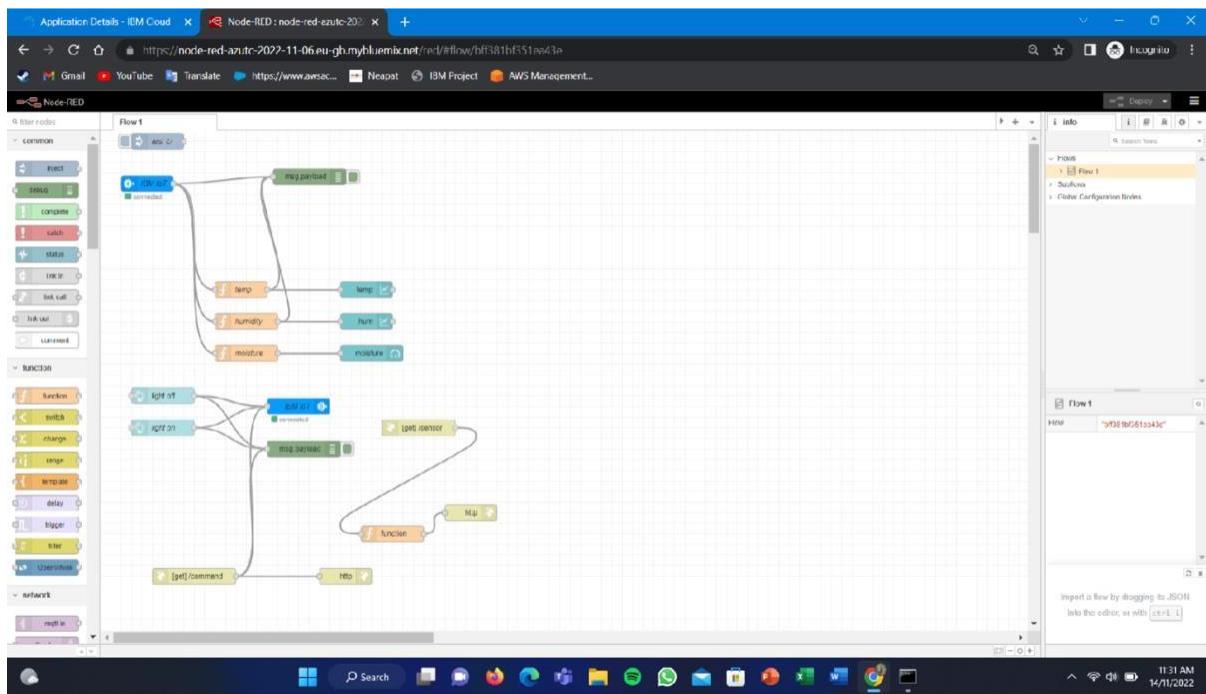

The 'Enabled' checkbox is checked, and the 'On all flows' dropdown is set to 'On all flows'. In the bottom right corner, a debug terminal window shows several log entries:

```
11/10/2022, 12:41:22 PM node: 852505a350d25d4 msg payload : string[9]
"Hello IBM"
11/10/2022, 12:41:22 PM node: 852505a350d25d4 msg payload : string[9]
"Hello IBM"
11/10/2022, 12:41:23 PM node: 852505a350d25d4 msg payload : string[9]
"Hello IBM"
11/10/2022, 12:41:23 PM node: 852505a350d25d4 msg payload : string[9]
"Hello IBM"
```

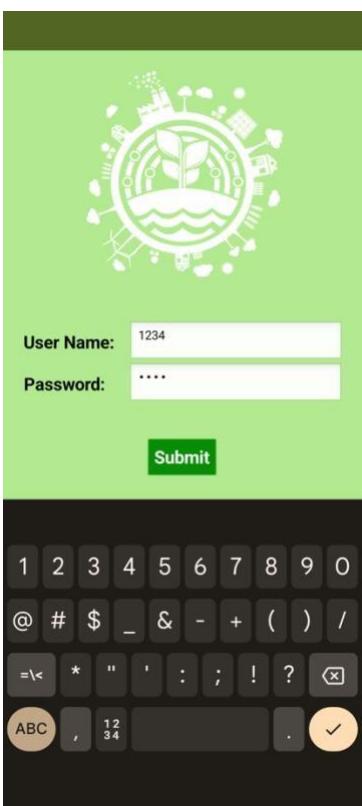

Data received from the cloud in Node – Red console

```
C:\WINDOWS\system32
Published Temperature = 109 C Humidity = 64 % to IBM Watson

```

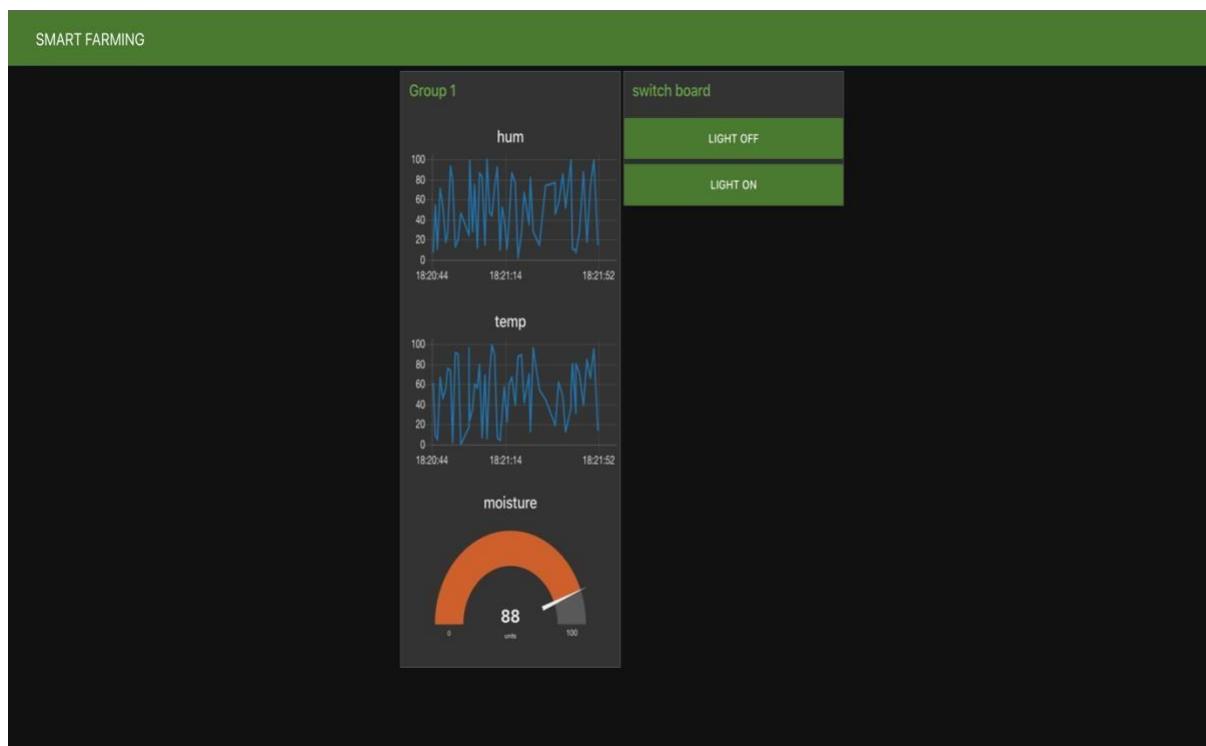

User Acceptance Testing

RESULT

Performance Metrics

ADVANTAGES & DISADVANTAGES

Advantages

The following are the benefits of adopting new technology - Internet of Things in Agriculture:

1. Climate Condition

IoT solution enables us to know the real-time weather conditions. Sensors are placed inside and outside of the agriculture fields. They collect data from the environment which is used to choose the right crops which can grow and sustain in the particular climatic conditions.

2. Precision Farming

The goal of precision farming is to analyse the data, generated via sensors, to react accordingly. Precision Farming helps farmers to generate data with the help of sensors and analyse that information to take intelligent and quick decisions. With the help of Precision farming, you can analyse soil conditions and other related parameters to increase the operational efficiency.

3. Smart Greenhouse

To make our greenhouses smart, IoT has enabled weather stations to automatically adjust the climate conditions according to a particular set of instructions. Adoption of IoT in Greenhouses has eliminated the human intervention, thus making entire process cost effective and increasing accuracy at the same time.

4. Data Analytics

Cloud based data storage and an end-to-end IoT Platform plays an important role in the smart agriculture system. These systems are estimated to play an important role such that better activities can be performed. In the IoT world, sensors are the primary source of collecting data on a large scale. The data is analysed and transformed to meaningful information using analytics tools. The data analytics helps in the analysis of weather conditions, livestock conditions, and crop conditions.

Disadvantages

1. Smart Agriculture requires internet connectivity continuously, but rural parts cannot fulfil this requirement.
2. Any faults in the sensors can cause great loss in the agriculture, due to wrong records and the actions of automated processes.
3. IOT devices need much money to implement.

CONCLUSION

IoT based SMART FARMING SYSTEM for Live Monitoring of Temperature and Soil Moisture and to control motor and light remotely has been proposed using Node Red and IBM Cloud Platform. The System has high efficiency and accuracy in fetching the live data of temperature and soil moisture. The IoT based smart farming System being proposed via this project will assist farmers in increasing the agriculture yield and take efficient care of food production as the System will always provide helping hand to farmers for getting accurate live feed of environmental temperature and soil moisture with more than 99% accurate results. Therefore, the project proposes a thought of consolidating the most recent innovation into the agrarian field to turn the customary techniques for water system to current strategies in this way making simple profitable and temperate trimming.

FUTURE SCOPE

In future due to more demand of good and more farming in less time, for betterment of the crops and reducing the usage of extravagant resources like electricity and water IOT can be implemented in most of the places
